

Lab C

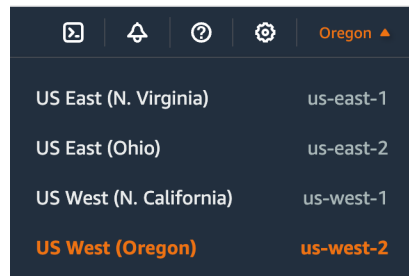

Creating a Virtual Network in the Cloud (VPC) with subnets (IP address ranges) and an EC2 with a MySQL RDS database within the VPC

1. Open the Learner Lab.

From our AWS canvas dashboard choose the Learner Lab and open the Modules and then the 'Launch AWS Academy Learner Lab' link. Make sure to click the Start lab link and wait for the AWS link to have the green circle next to it and open the lab.

Change the region to US West (Oregon) for this lab.

2. Create a Virtual private cloud network

We will set up a virtual network that we have complete control over.

Open the VPC service and select 'Your VPCs' in the left side panel.

You are always provided default VPC(s). We will be creating a new one. Click 'Create VPC'.

Leave the defaults of 'VPC only',

Give the VPC a Name tag.

Leave the IPv4 CIDR (Classless Inter-domain routing) manual input.

We will be creating a range of 64 IP addresses. So, type in 10.0.0.0/26

IPv4 CIDR
10.0.0.0/26
CIDR block size must be between /16 and /28.

Leave the rest of the defaults and click 'Create VPC'

Create VPC

Now when you click on 'Your VPCs' you will see your new VPC and see that it's available.

3. Create four subnets (ranges of IP addresses) inside your VPC.

Now click on 'Subnets' in the left side panel. You need subnets in your VPC that specify IP address ranges inside AZs to allocate virtual machines and other services.

Notice there are subnets already set up for our default VPC. We need to create subnets in our new VPC. Click 'Create subnet'

Create subnet

We will set up 4 subnets, 2 public (like applications on the internet) and 2 private (like application servers). Public subnets have access to the internet whereas private subnets have no access to the internet. Each subnet will get 16 of the 64 IP addresses each. Multiple AZs insures high availability.

Select the VPC that you will be creating this subnet for. Choose the VPC you just created.

Create subnet <small>Info</small>
VPC
VPC ID Create subnets in this VPC.
Select a VPC
Q
vpc-0984c8dc7053925fc (vpc_mysql) 10.0.0.0/26

Name this first subnet private_a.

Subnet 1 of 1

Subnet name

Create a tag with a key of 'Name' and a value that you specify.

private_a

The name can be up to 256 characters long.

Choose an availability zone us-west-2a.

Availability Zone [Info](#)

Choose the zone in which your subnet will reside.

US West (Oregon) / us-west-2a

Change the 'IPv4 CIDR block' to 10.0.0.0/28 for the first 16 IP addresses.

IPv4 subnet CIDR block

10.0.0.0/28

Use the rest of the defaults for the first subnet.

Click the 'Add new subnet' button.

Add new subnet

For subnet 2 of 2, give it the name of private_b. Choose a different AZ us-west-2b. Change the 'IPv4 CIDR block' to 10.0.0.16/28 for the next 16 IP addresses.

Subnet 2 of 2

Subnet name

Create a tag with a key of 'Name' and a value that you specify.

private_b

The name can be up to 256 characters long.

Availability Zone [Info](#)

Choose the zone in which your subnet will reside, or let Amazon choose one for you.

US West (Oregon) / us-west-2b

IPv4 VPC CIDR block [Info](#)

Choose the IPv4 VPC CIDR block to create a subnet in.

10.0.0.0/26

IPv4 subnet CIDR block

10.0.0.16/2816 IPs

Leave the rest defaults and click ‘Create subnet’.

Now we have 2 private subnets in two AZs.

Repeat the process above to create two more subnets. The only difference will be that these 2 subnets will be public.

public_a in us-west-2a with the IP range for the first will be 10.0.0.32/28

public_b in us-west-2b with the IP range for the second will be 10.0.0.48/28

When you click ‘Subnets’ you should now see, in addition to the default subnets, your 4 new subnets (you might need to clear filters to see them)

<input type="checkbox"/>	public_b	subnet-062ac3f27c6a7617c	✔ Available
<input type="checkbox"/>	public_a	subnet-0ac2cc05885686eeb	✔ Available
<input type="checkbox"/>	private_b	subnet-0ec257c8ab3949fb4	✔ Available
<input type="checkbox"/>	private_a	subnet-04c0a9a97e206f285	✔ Available

Notice under the available IPv4 addresses column it shows 11 in each subnet. That’s 11 for each not 16. The last 5 are reserved by AWS for IP networking purposes.

4. Create routing tables

Routing tables determine where network traffic from your subnet or gateway is directed.

Click ‘Route tables’

Again, you will see default route tables used with the default VPC. We will create 2 route tables for our VPC, one private and one public. We will associate our subnets into the route tables.

Click 'Create route table'.

Name the first private route table.

Route table settings

Name - *optional*

Create a tag with a key of 'Name' and a value that you specify.

private_rt

Choose our VPC.

VPC

The VPC to use for this route table.

Select a VPC

Q |

vpc-0984c8dc7053925fc (vpc_mysql)

Click 'Create route table'.

Create another public route table the same way, 'public_rt' using the same VPC.

5. Associate your routing tables with the subnets.

Now when you click 'Route tables' you will see them listed. Check the private route table.

☒

private_rt

Click the 'Subnet associations' tab below.

Details

Routes

Subnet associations

Edge associations

Click the 'Edit subnet associations'.

Edit subnet associations

Check the 2 private subnets to associate with the private routing table.

<input type="checkbox"/>	public_b
<input checked="" type="checkbox"/>	private_b
<input checked="" type="checkbox"/>	private_a
<input type="checkbox"/>	public_a

Click 'Save associations'

Save associations

Now check public route table and associate it with the 2 public subnets the same way we did the private ones.

You should now see 2 subnets associated with each route table.

private_rt	rtb-0f2f12d6d1a328ff0	2 subnets
public_rt	rtb-015052355dac3ea79	2 subnets

6. Create internet traffic to our public subnet with an Internet Gateway

Click 'Internet gateways' on the side panel.

Internet gateways

There are already default gateway(s). We will create our own.
Click 'Create internet gateway'

Create internet gateway

Name your gateway.

Internet gateway settings
<p>Name tag Creates a tag with a key of 'Name' and a value that you specify.</p> <div><input type="text" value="mysql_igw"/></div>

Leave other defaults. Click 'Create internet gateway'.

Create internet gateway

7. Attach the internet gateway to our VPC.

When you click 'Internet gateways' again, you will see the new gateway, but it will have the state of 'Detached'. We need to attach it to our VPC.

Check the box next to the new internet gateway and under 'Actions' click 'Attach to VPC'.

Actions ▲
View details
Attach to VPC

Select our VPC and then click 'Attach internet gateway'.

8. Add a route to the public routing table to route internet traffic to the internet gateway.

Click the 'Route tables' again and check the box next to the public route table. Then choose the 'Routes' tab.

Routes

Click 'Edit routes'

Edit routes

There is a default local destination. We want to add another. Click 'Add route'.

Add route

Add destination of 0.0.0.0/0 to allow all traffic to the Internet Gateway

Destination

0.0.0.0/0

And Target 'Internet Gateway'. Then choose the internet gateway you created earlier.

Target

igw-

igw-01afbef22f7c14d30 (mysql_igw)

Click 'Save changes'

Save changes

9. Create a Subnet for the Database

Inside our network we will be running a database. That's why we've been naming everything MySQL. Find the RDS service.

Before we create a database. We need to create a subnet group within RDS. Click 'Subnet groups' on the left.

Subnet groups

Click 'Create DB subnet group'

Create DB subnet group

Give it a name.

Name

You won't be able to modify the name after your subnet group is created.

mysql_private_subnet_group

Must contain from 1 to 255 characters. Alphanumeric and hyphens only.

Add a description

Description

MySQL private subnet group

Choose our VPC

VPC

Choose a VPC identifier that corresponds to the subnets in your VPC. You can't change the VPC identifier after your subnet group has been created.

Choose a VPC

vpc_mysql (vpc-0984c8dc7053925fc)

Choose the 2 AZs we have used.

Availability Zones

Choose the Availability Zones that include

Choose an availability zone

<input checked="" type="checkbox"/>	us-west-2a
<input checked="" type="checkbox"/>	us-west-2b
<input type="checkbox"/>	us-west-2c
<input type="checkbox"/>	us-west-2d

Select the private subnet from each AZ.
10.0.0.16/28 and 10.0.0.0/28

Subnets

Choose the subnets that you want to add. The list includes the subnets in the se

Select subnets

us-west-2b	
<input type="checkbox"/>	subnet-02ccc9acea7c73e94 (10.0.0.48/28)
<input checked="" type="checkbox"/>	subnet-09ce747a0b97e14c9 (10.0.0.16/28)
us-west-2a	
<input type="checkbox"/>	subnet-0a41465a09ff9683b (10.0.0.32/28)
<input checked="" type="checkbox"/>	subnet-0aed2af967b17b4eb (10.0.0.0/28)

Then click 'Create'

Create

10. Create a MySQL Database Instance

Now we will create the database.

Click 'Databases' on the left panel and 'Create database'

Create database

We will choose the 'Standard create' and the engine we will use is MySQL.

☒ **Standard create**
 You set all of the configuration options, including ones for availability, security, backups, and maintenance.

☐ **Easy create**
 Use recommended best-practice configurations. Some configuration options can be changed after the database is created.

Engine options

Engine type [Info](#)

☐ Aurora (MySQL Compatible)

☐ Aurora (PostgreSQL Compatible)

☒ MySQL

Choose 'Free tier' under Templates.

Templates

Choose a sample template to meet your use case.

☐ **Production**
 Use defaults for high availability and fast, consistent performance.

☐ **Dev/Test**
 This instance is intended for development use outside of a production environment.

☒ **Free tier**
 Use RDS Free Tier to develop new applications, test existing applications, or gain hands-on experience with Amazon RDS. [Info](#)

In the 'Settings' section. Give it a name of mysql-db and ***use a dash not an underscore here.***

Settings

DB instance identifier [Info](#)
 Type a name for your DB instance. The name must be unique across all DB instances in the current AWS Region.

The DB instance identifier is case-insensitive. Constraints: 1 to 60 alphanumeric characters, including hyphens. Can't end with a hyphen.

Add login information. I used 'password' as the password for this lab and left the admin username.

▼ Credentials Settings

Master username [Info](#)

Type a login ID for the master user of your DB cluster

admin

1 to 16 alphanumeric characters. The first character must be a letter.

☐ Manage master credentials in AWS Secrets Manager
Manage master user credentials in Secrets Manager to manage it throughout its lifecycle.

ⓘ

If you manage the master user credentials in AWS Secrets Manager, you can use the [AWS CLI](#) to rotate the master user password.

[Learn more](#) [↗](#)

☐ Auto generate a password
Amazon RDS can generate a password for you, which you can use to connect to the database.

Master password [Info](#)

.....

Constraints: At least 8 printable ASCII characters. Cannot contain spaces or the following characters: !@#\$%^&*()_+{}|;':",./~`-=[]\;'()@{}~`-=[]\;'()

Confirm master password [Info](#)

.....

Choose the db.t2.micro.

db.t2.micro

1 vCPUs 1 GiB RAM Not EBS Optimized

Leave other defaults until 'Storage autoscaling' open that section up and uncheck 'Enable storage autoscaling'

▼ Storage autoscaling

Storage autoscaling [Info](#)

Provides dynamic scaling support for your database instance.

☐ Enable storage autoscaling
Enabling this feature will allow the storage capacity of the database instance to scale automatically.

In the 'Connectivity' section choose our VPC.

Connectivity [Info](#)

Compute resource
Choose whether to set up a connection to a compute resource for this database. The connection will automatically change connectivity settings so that the compute resource can connect to the database.

☒ **Don't connect to an EC2 compute resource**
Don't set up a connection to a compute resource for this database. You can manually set up a connection to a compute resource later.

☐ **Connect to an EC2 compute resource**
Set up a connection to a compute resource for this database.

Virtual private cloud (VPC) [Info](#)
Choose the VPC. The VPC defines the virtual networking environment for this database.

vpc_mysql (vpc-0984c8dc7053925fc)
4 Subnets, 2 Availability Zones

Only VPCs with a corresponding DB subnet group are listed.

We don't want Public access, so leave it No.

Public access [Info](#)

☐ **Yes**
RDS assigns a public IP address to the database instance. Resources outside of the VPC can connect to your database. Choose one or more VPC security groups for the database.

☒ **No**
RDS doesn't assign a public IP address to the database instance. Only resources inside the VPC can connect to your database. Choose one or more VPC security groups that specify which resources can connect to the database.

Create a new security group and name it. This is a firewall for our database. You use security groups to control traffic at the instance level and NACL (Network access control lists) to control access at the subnet level. Choose the AZ.

VPC security group (firewall) [Info](#)
Choose one or more VPC security groups to allow access to your database. Make sure that the security group rules allow for appropriate incoming traffic.

☐ Choose existing
Choose existing VPC security groups

☒ Create new
Create new VPC security group

New VPC security group name

mysql-db-sg

Availability Zone [Info](#)

us-west-2a ▼

Leave the password authentication.

Under 'Additional configuration' give the database a name.

Database options

Initial database name [Info](#)

mysql_db

Uncheck enable automated backups.

Backup

☐ Enable automated backups
Creates a point-in-time snapshot of your database

Leave the rest on defaults and click 'Create database'.

Create database

If it suggests add-ons, just close that window.

Wait for the database to set up. Do step 10 while you wait.

11. Set up a security group for our EC2.

Go to the EC2 service and click 'Security groups' on left side (scroll down a bit)

Network & Security

Security Groups

Click 'Create security group'

Create security group

Give it a name, description, and choose our VPC. You might have to delete the default VPC to see our VPC option. Choose our VPC.

Basic details
Security group name Info
<input type="text" value="mysql-ec2-sg"/>
<small>Name cannot be edited after creation.</small>
Description Info
<input type="text" value="security group for EC2"/>
VPC Info
<input type="text" value="vpc-0edb5e3fc7781d278"/>

Click 'Add rule' under Inbound rules.

Add two rules as follows:

Should be:

Type info – http

Protocol info - leave TCP

Port range - leave 80

Source info – 0.0.0.0/0

Type Info	Protocol Info	Port range Info	Source Info
<input type="text" value="HTTP"/>	<input type="text" value="TCP"/>	<input type="text" value="80"/>	<input type="text" value="Any..."/>
			<input type="text" value="0.0.0.0/0"/>

Add another inbound rule with the 'Add rule' button.

Type info – RDP

Protocol info - leave TCP

Port – leave default 3389

Source info - custom BYUI 157.201.0.0/16

HTTP	TCP	80	Any...	<input type="text" value="0.0.0.0/0"/>
RDP	TCP	3389	Cust...	<input type="text" value="157.201.0.0/16"/>

Click 'Create security group'

Create security group

12. Edit the inbound rules for the database

Go back to RDS and check that your database finished.

Click on the database name.

Scroll down and click on inbound security groups

Security group rules (2)	
<input type="text" value="Filter by Security group rules"/>	
Security group	Type
mysql-db-sg (sg-0db5a4b23fc34f14b)	CIDR/IP - Inbound

Click on the inbound rule. Click on the inbound tab. Click 'edit inbound rules' button.

Add an inbound rule

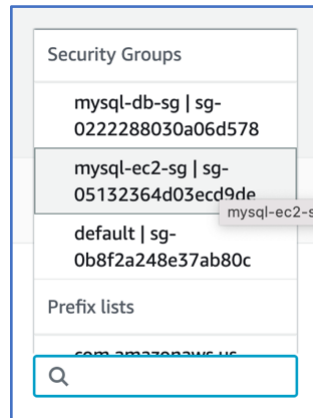

Type info – MYSQL/Aurora

Protocol – leave TCP

Port range – leave 3306

Source info – custom

Choose the security group you had for your ec2 security group
(You might have to close the default that is there and scroll down a bit in your choices to see it.)

Click 'Save rules'

13. Create a Windows server

Create a windows server again like Lab B but
Use t3a.large (step 5 in lab b)

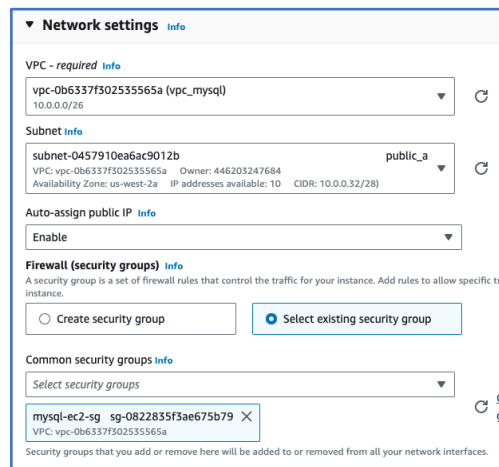

And Edit 'Network Settings':

Choose our VPC

Make sure the subnet is public not private

Enable Auto-assign public IP

Select existing security group and find our EC2 security group
'mysql-ec2-sg'

Launch the instance. Your instance might take a few minutes to run and have 2/2 checks before you can connect with the next window. Once it's done, check the box next to the instance and connect. Use the RDP tab and download remote desktop file. Double click the .rdp file that downloaded.

Use the 'Get password' to get the remote desktop password from the .pem file.

You could now download Workbench and connect to the database by using the EC2 end point as the host.
